

Nano Premixer PR-1

The Next Generation of Nano Dispersion **Excellent Dispersing Performance**

The Nano Premixer uniformly disperses nanomaterials in an enclosed container. The container rotates around its axis and is treated by ultrasonic waves from the sides and the bottom to achieve an uniform dispersion.

**Adjustable RPM**

The rotation of the container generates circulation by convection to achieve an uniform dispersion.

Dual-Sonic System

The container is treated by ultrasonic waves from the sides and the bottom of the bath so that the nanomaterial is deagglomerated and dispersed.

Small Batch Processing

Using a vial, the maximum volume of material is 5 ml/50 mg

Minimum Cross Contamination

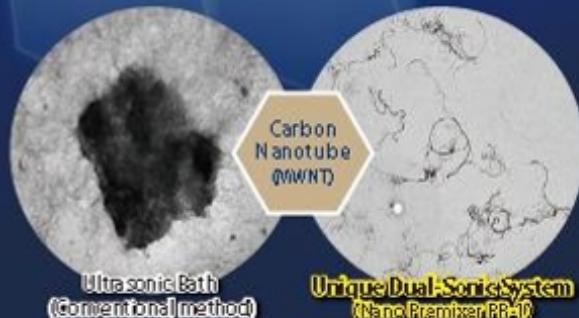

Minimum crosscontamination is achieved since the material is dispersed in an enclosed container.

Cooling System

The ultra sonic bath is cooled to prevent overheating of the material.

Temperature Control

To keep the material properties, dispersion process is completed within the set temperature limits.

A New Approach to Uniformly Disperse Nanomaterials

Unique Dual-Sonic System (Nano Premixer PR-1)

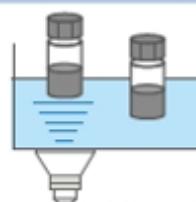

Since the distance between the water level and the ultrasonic transducer is fixed, and rotation of avial generates stable circulation by convection, high reproducibility and dispersibility can be achieved.

Patented

Output
140 WVial
Max. 5 mlSUS Container
Max. 200 ml

Different vials can be set. Please ask for more information.

Ultrasonic Bath System (Conventional method)

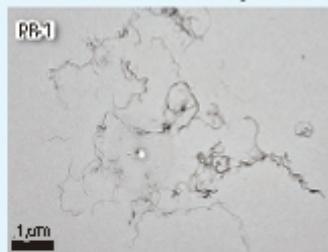

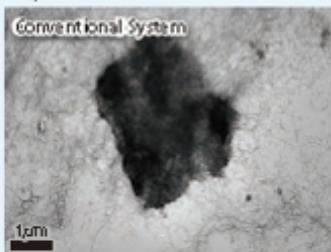

Reproducibility and dispersibility is poor since the distance between the water level and the ultrasonic transducer varies.

Application

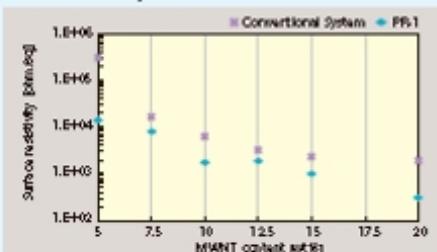

■ Multi-Walled Carbon Nanotube (MWNT)

Uniform dispersion of agglomerated nano fiber is achieved without shearing.

Dispersion Difference between Conventional "Ultrasonic Bath System" and New "Dual-Sonic System"

Agglomeration remains when the sample is treated in a conventional ultrasonic bath.
PR-1 can deagglomerate and uniformly disperse the sample.

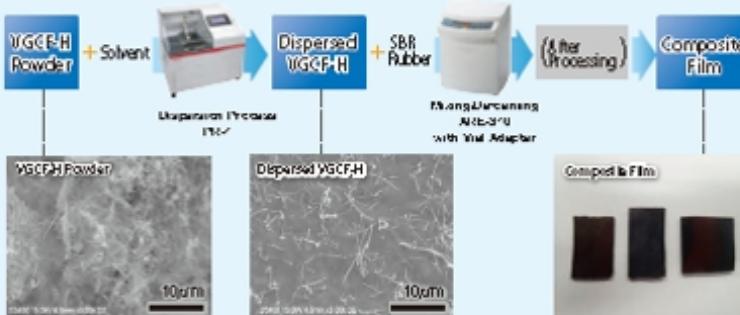

Compared to a conventional ultrasonic bath machine, lower resistivity (higher dispersion effect) can be observed with PR-1.

■ Vapor Grown Carbon Fiber (VGCF-H)

Without changing the container, other materials can be added to the same dispersed material and mixed/defoamed with ARE-310/ARE-250CE.

Example of VGCF-H Dispersion and SBR Composite Film

Specifications

Ultrasonic wave Transducer output	Max. 70W x 2 transducers (side and bottom)
Ultrasonic wave Frequency	40kHz
Rotation speed	80 - 600 rpm
Timer setting range	0 hour 00min 00sec to 2 hours 00min 00sec (Max. 2 hours run /Setting) (in the unit of sec)
Maximum processing volume	<ul style="list-style-type: none"> - 6 ml Vial - 5ml (50 mg) - 200 ml SUS Container - 200 ml Different vials can be set. Please ask for more information.
Standard container	Vial (capacity: 5 ml)
External dimensions	400 mm(H) x 450 mm(W) x 380 mm(D)
UNIT Weight	Approx. 25 kg
Power Supply	1φ AC85 - 265V (47Hz - 63Hz) Continuous input

*Product appearance/specifications may change without notice.
